

Ten years, Twenty Lead Designers,
No Money

The technical hurdles of
WorldForge

The WorldForge Project

- A community Open Source MMO project.
- Born when Open Source was making big press.
- First major attempt to mimic emerging MMORPG.
- Open Source rivaled many proprietary products.
- Why not MMOs?

Why not?

- Not just a software project.
- Content is king!
- Programmers are motivated by the hacker ethic.
- What motivates everyone else?

Game Design

- Everyone is a Game Designer!
- Whose design will we choose?
- Focus on design neutral development.
- Meritocracy influences direction.
- The hardest workers have the most say.

Network Communication

- Most games use a bespoke protocol.
- How do we handle game specific data?
 - One client per game?
 - Pluggable protocols?

World Data

- To many "Massive" means world size.
- Games at the time had static maps.
- Many games, each with a massive map?
- Massive worlds with small downloads.
- Represent the world as a dynamic graph.
- Only download what is visible.
- Compress everything.

Graphics

- Isometric was standard.
- 3D emerging fast, but looks terrible.
- Open Source purists have no 3D.
- 2D artists want their work to look great.
- 3D allows more flexibility.
- The core system had to support both.
- 3D artists motivated by bleeding edge.

More than ...

- 10 years of development
- 100 contributors
- 1000 package files released
- 10000 files of source code
- 100000 package files downloaded
- 1000000 lines of C++
- 10000000 dollars of value
- 100000000000 bytes of content

Game Design - Mason

- The current phase of a series of designs.
- A game about world building.
- Game starts with a virgin natural world.
- Settlements are built by players.
- The concept is appealing to programmers.

World Data - Mercator

- A different game world in every server.
- Quasi-random terrain.
 - Small download from server
 - Same terrain on every client
 - Natural looking height fields
 - Procedural texturing
- Height modifiers.
- Texture patches.
- Procedural vegetation distribution.

Network Communication - Atlas

- An interface independent protocol.
 - Simple low cost data format.
 - Object based messaging.
 - Core object model.
 - Convention for interaction.
- Represents the world in abstract form.
- Easy to extend at the right level.
- Changes needed have been minimal.
- Survived 6 client iterations.

Modeling Tools - Blender

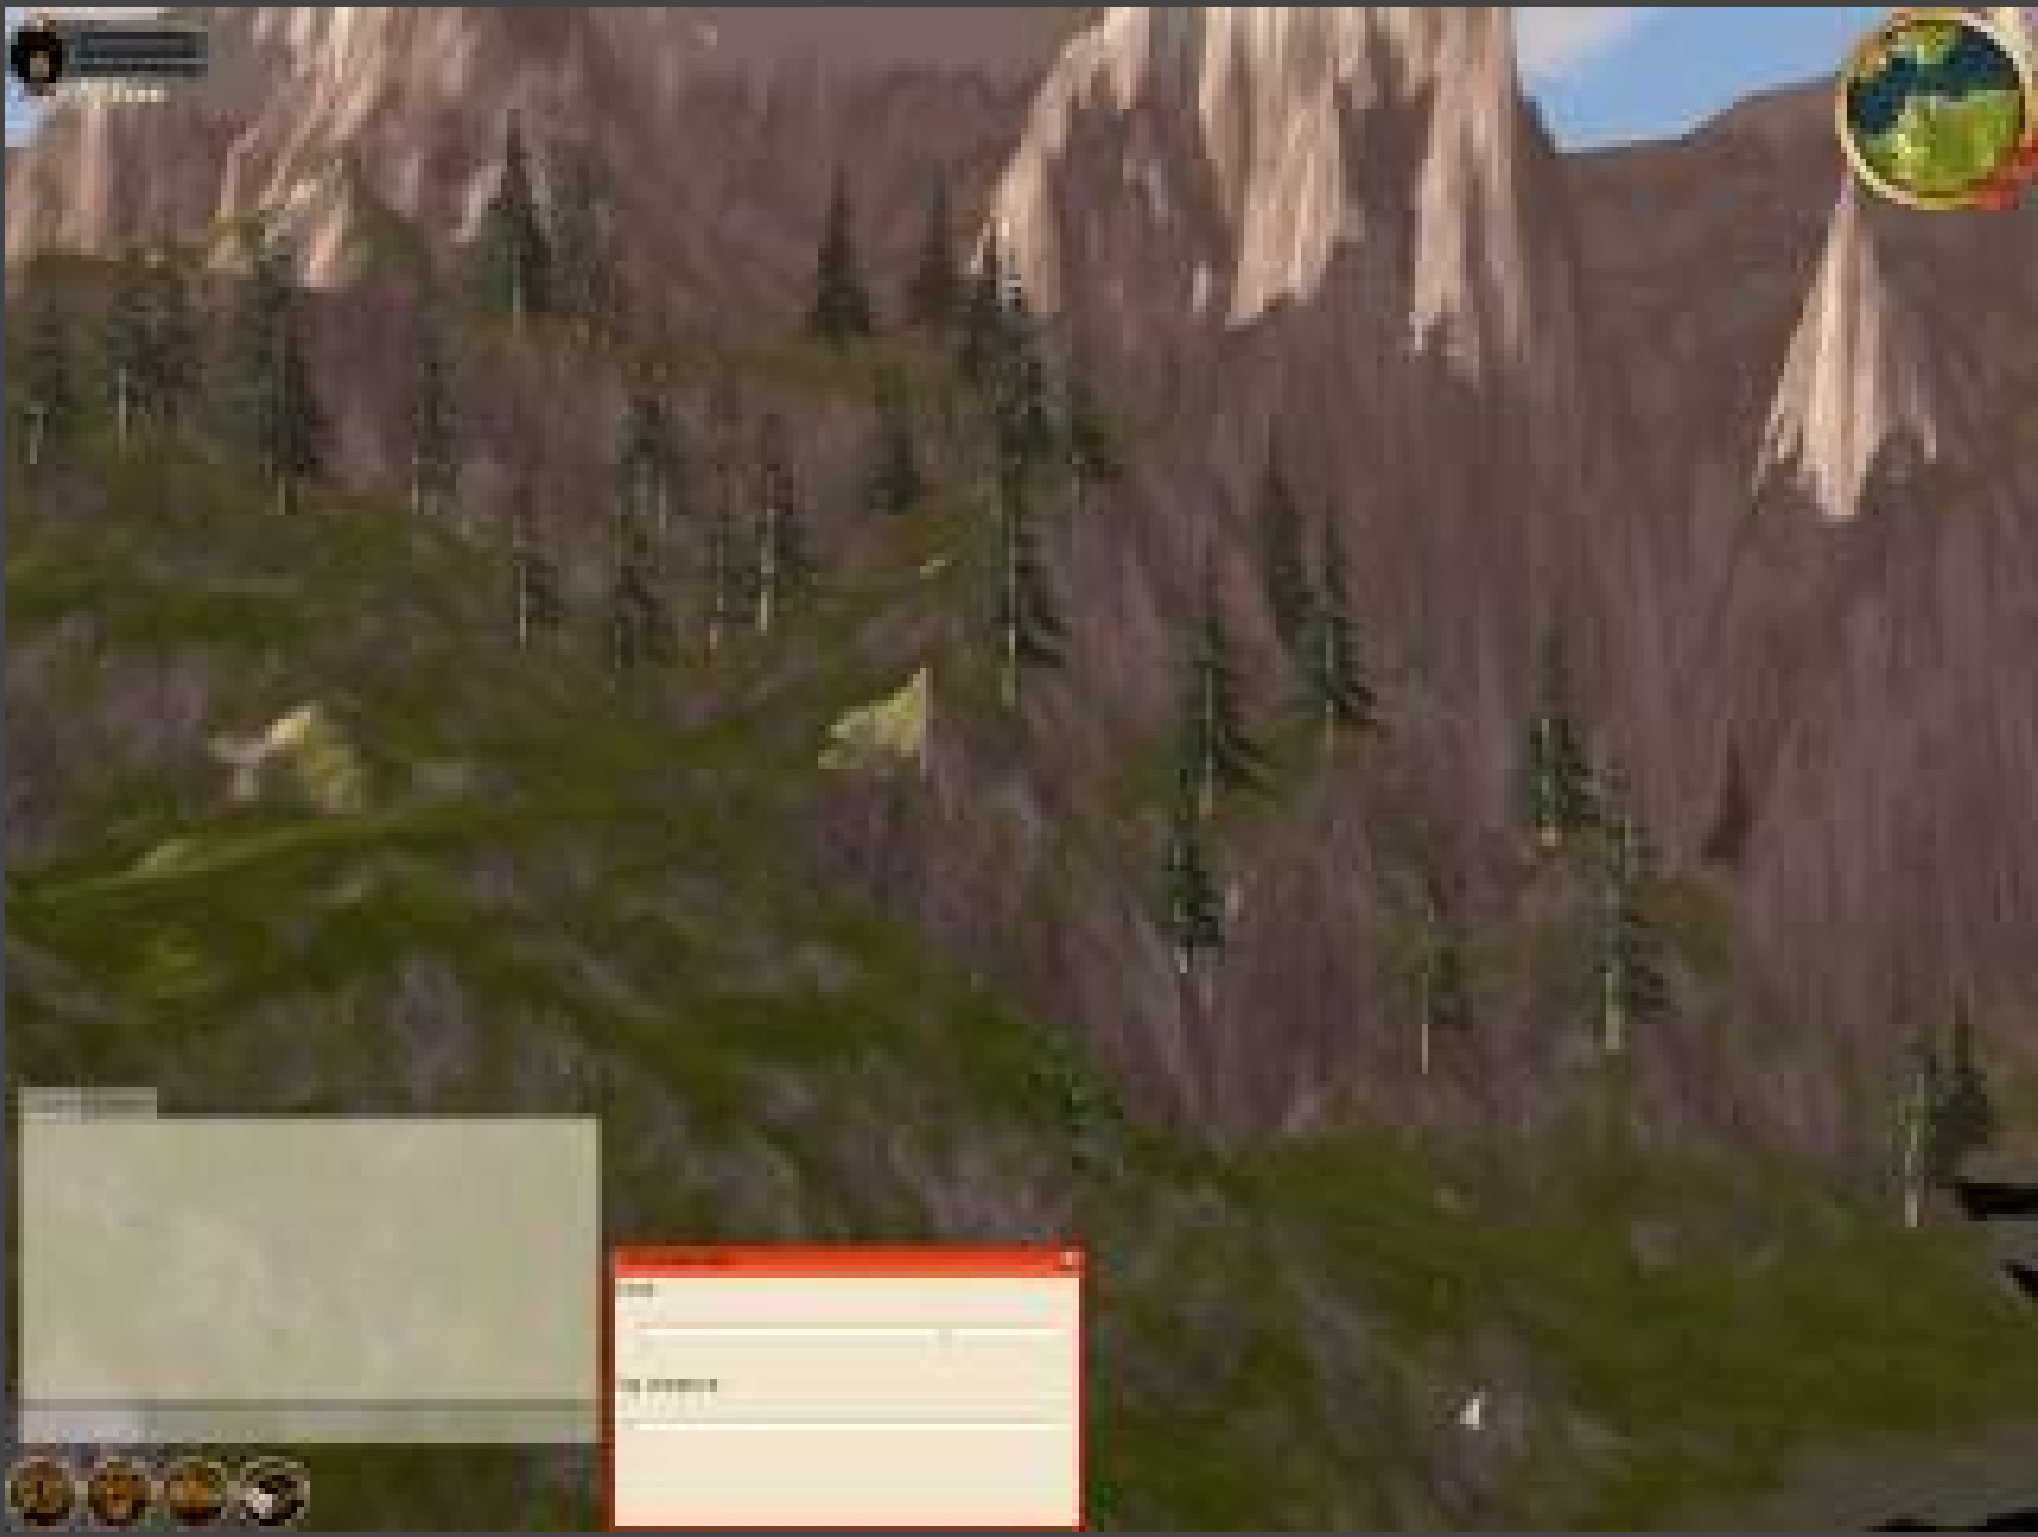

- Everquest made 3D relevant from the start.
- Which format and tool.
 - Tool specific, interchange or engine format
 - Similar to source and binary code.
- Proprietary tool specific formats are not Open.
- Artists are very attached to their own tools.

The Blender Foundation

- Blender written as a proprietary modeller.
- Not a Number went bankrupt in 2002.
- Creditors agreed to sell software assets for \$100000.
- Sometimes money is the only solution.
- The Blender Foundation aggregated our donations.
- WorldForge became a silver sponsor.

Graphics - OGRE 3D

- Two isometric engines.
- Three custom rendering engines.
- Two third party scene graphs.
- OGRE 3D takes the burden away from us.
- Powerful renderer.
- Huge quantity of third party modules.

Game interface showing a menu or settings screen. The screen is divided into several sections with various options and values.

Item	Value
Item 1	1000
Item 2	1000
Item 3	1000
Item 4	1000
Item 5	1000
Item 6	1000
Item 7	1000
Item 8	1000
Item 9	1000
Item 10	1000
Item 11	1000
Item 12	1000
Item 13	1000
Item 14	1000
Item 15	1000
Item 16	1000
Item 17	1000
Item 18	1000
Item 19	1000
Item 20	1000

Additional elements include a search bar, a list of items, and a bottom navigation bar with several icons.

This is a screenshot from a game showing a village scene. The text box in the bottom left corner contains the following text:
